Executive Summary

The Federal Motor Carrier Safety Administration (FMCSA) carries out a multiyear Motor Carrier Research & Technology (R&T) Program under the authority of 49 USC 31108. The R&T Program includes in-house, contract, congressionally mandated, and joint-funded initiatives with other U.S. Department of Transportation (USDOT) organizations, the private sector, and academia. FMCSA is authorized to carry out research, development, and technology transfer activities with respect to:

- Factors contributing to crashes, injuries, and fatalities involving commercial motor vehicles (CMVs).
- Means of reducing the number and severity of crashes, injuries, and fatalities involving CMVs.
- Improving CMV safety and efficiency through technological innovation and improvement.
- Improving technology used by enforcement officers when conducting roadside inspections and investigations to increase efficiency and information transfers.
- Increasing the safety and security of hazardous materials transportation.

FMCSA’s mission is to reduce crashes, injuries, and fatalities involving large trucks and buses. The R&T Program serves as the underpinning for empirically answering research questions in support of the Agency’s safety mission and the overall Departmental goals of Safety and Innovation. Using research to better understand factors associated with crashes, FMCSA can streamline and prioritize its enforcement efforts, focusing on vital Federal safety oversight functions.

Collaboration Efforts

FMCSA collaborates closely with product end-users—including internal FMCSA program offices and other USDOT modes—to identify common research needs and streamline existing and planned research efforts. The Agency works closely with the National Highway Traffic Safety Administration (NHTSA), the Federal Highway Administration (FHWA), and the Intelligent Transportation Systems Joint Program Office (ITS JPO) to answer research questions related to automated and connected CMVs, heavy vehicle crash avoidance, and enterprise data, and to accelerate the deployment of CMV safety technologies.

FMCSA also collaborates with external stakeholders and partners. The Agency regularly receives, reviews, and responds to safety-related CMV driver, carrier, and vehicle research and policy recommendations from the National Transportation Safety Board (NTSB), the National Academy of Sciences (NAS), the Transportation Research Board (TRB), the Committee on National Statistics (CNSTAT), the Motor Carrier Safety Advisory Committee (MCSAC), and other organizations. FMCSA
evaluates recommendations from these organizations and adjusts the R&T agenda as needed. Where appropriate, FMCSA partners with external organizations—such as the National Institute of Occupational Safety and Health (NIOSH), the Department of Energy, and the Commercial Vehicle Safety Alliance (CVSA)—to conduct relevant CMV driver, carrier, and vehicle safety research. FMCSA also maintains close contact with the motor carrier industry, collaborating with industry associations and motor carriers to advance safety improvement efforts.

**Strategic Objectives and Critical Programs**

FMCSA’s R&T Program has established the following strategic objectives:

- **Produce Safer Drivers:** Develop driver-based safety countermeasures to reduce crashes.
- **Improve Safety of CMVs:** Improve truck and motorcoach safety through vehicle-based research and the deployment of CMV safety technologies.
- **Produce Safer Carriers:** Improve motor carrier safety by compiling and communicating best management practices to motor carriers and work with industry to accelerate adoption of safety-enhancing technology, such as automatic emergency braking (AEB) systems.
- **Advance Safety through Information-Based Initiatives:** This strategic objective encompasses automated commercial vehicle research and support for the Innovative Technology Deployment (ITD) Grant Program, the Agency’s key mechanism for transferring proven enforcement technologies into operational systems for the States.
- **Enable and Motivate Internal Excellence:** Ensure the relevance, quality, and performance of research and technology activities and develop efficient methods to respond quickly and flexibly to Departmental and Agency needs.

FMCSA’s FY 2020 R&T activities, which primarily align with the USDOT Strategic Goals of Safety and Innovation, have two key focus areas: 1) automated CMV research and development, and 2) research to support Agency efforts to produce safer commercial drivers, carriers, and vehicles.

**Anticipated Outcomes**

FMCSA’s R&T Program develops the knowledge, practices, and technologies needed to solve problems that arise in prioritizing Agency resources and improving the safety of commercial drivers, vehicles, and carriers. Crashes involving CMVs are extremely costly; in 2016, the estimated costs of all large truck and bus crashes was $134 billion (see Table 1). In 2017, 5,005 fatalities involved large truck and bus crashes (FMCSA, Large Truck and Bus Crash Facts 2017). In general, research conducted by FMCSA contributes to the development of safety technologies (for use by enforcement and commercial carriers) and recommended best practices to improve driver performance and the safe operation of CMVs, thus contributing to a reduction in crashes. By completing targeted research, FMCSA will:

<table>

</tr>
</tbody>
</table>

*Beginning with data for 2016, NHTSA replaced the General Estimates System with the Crash Report Sampling System. Comparisons of 2016 injury and PDO crash costs with pre-2016 estimates should thus be performed with caution.

Source: 2018 Pocket Guide to Large Truck and Bus Statistics, Table 4-22.
• Better understand the contributing factors and impacts of CMV crashes and inform efforts to develop safety countermeasures to reduce crashes.
• Better understand the safety impacts associated with the adoption of automated CMVs.
• See continued progress in the development and testing of CMV safety technologies.

Ultimately, FMCSA’s R&T efforts will contribute to the Agency’s mission of reducing the number and severity of CMV-involved crashes on the Nation’s highways, reducing costs to the American public and saving lives.
Chapter 1. Introduction / Agency-Wide Research Approach

Federal Role / Continued Relevance

Program Purpose and Mission

The purpose of the Research and Technology (R&T) Program is stated in 49 U.S.C. 31108, which establishes a motor carrier and motorcoach research and technology program and delineates the program requirements. Under 49 USC 31108, paragraph (a)(3)(C), the Federal Motor Carrier Safety Administration (FMCSA) may fund research, technology, and development projects that improve the safety and efficiency of commercial motor vehicle (CMV) operations through technological innovation and improvement. Using 49 USC 31108 as a basis, the R&T Program has established the following mission statement:

The R&T Program supports FMCSA's overall mission of reducing crashes, injuries, and fatalities involving large trucks and buses by:

- Providing data, producing statistics, and conducting systematic studies directed toward fuller scientific discovery, knowledge, or understanding, and
- Identifying, testing, and supporting technology transfer activities and deployment of CMV safety technologies.

Strategic objective areas include:

- Produce safer drivers.
- Improve safety of commercial motor vehicles.
- Produce safer carriers.
- Advance safety through information-based initiatives.
- Enable and motivate internal excellence.

Setting and Meeting Short- and Long-Term Objectives

FMCSA reviews and adjusts its research and technology portfolio each fiscal year to ensure it is addressing relevant, priority issues. Specific R&T Program goals respond to Departmental and Agency priorities, Congressional mandates, Office of Inspector General and Government Accountability Office directives, etc. Completed research is meant to support the efforts of other program offices (e.g., Enforcement, Policy, etc.) or to meet other Federal requirements.

Why the R&T Program Is Necessary

CMV crashes can result in loss of life, debilitating injuries, and significant damage to property and surrounding infrastructure. FMCSA's R&T activities help the Agency target its limited resources to the highest-risk carriers and develop programmatic initiatives that address the most important driver, carrier, and CMV safety issues.

The R&T program is necessary to promote the enforcement and safe operation of motor carriers transporting goods and passengers on U.S. roadways. Without this program, FMCSA, USDOT, individual States, and the larger CMV safety community cannot effectively carry out or modify their current programs based on scientific evidence and data analysis.
Research Portfolio Information

FMCSA publishes every R&T publication in the National Transportation Library’s digital repository, currently known as the Repository and Open Access Science Portal (ROSA-P). The Agency also works to update project summaries and related content in the Transportation Research Board (TRB) Research in Progress (RiP) database. Project summaries listed in the RiP database link to the “master” project summary published on the FMCSA website, which is periodically updated to reflect changes in milestones or funding or to include links to final reports (hosted in ROSA-P). When applicable, public-use datasets are provided on project pages on the FMCSA website. In the future, the Agency will make all of its public-use datasets available via the FMCSA Data Repository (currently in beta status).

Commitments of Staff Time and Resources

FMCSA’s R&T Program receives approximately $9M in Congressional appropriations annually and operates with 10 full-time equivalent (FTE) Federal employees and limited contractual support. FMCSA devotes the necessary resources to ensure reports are released in a timely fashion and website information is kept up to date.

Acquisition/Assistance:

Procurement Processes

The R&T Program utilizes competitive procurement processes. FMCSA primarily utilizes a competitively awarded indefinite delivery, indefinite quantity (IDIQ) contract with four different research organizations. The R&T Program follows the guidance and processes established by the FMCSA Acquisitions and Budget Offices. This ensures contracts are awarded and funds are allocated according to Agency best practices.

Acquisition Methods

FMCSA uses a variety of acquisition methods, including a multiple-contractor IDIQ (established through full and open competition), interagency agreements, blanket purchase agreements (established through full and open competition), small business set-asides, and full and open competition.

Single- versus Multi-Year Acquisitions

FMCSA utilizes both single-year and multi-year acquisitions. Some research projects are fully awarded up front. Other projects have a base year with one or more option years. This model allows FMCSA to assess the progress of a particular research project and decide whether to invest additional research dollars or redirect funds, if needed.

How the Program Leverages Non-Federal Funds

1 The organizations on FMCSA’s current IDIQ contract include the Virginia Tech Transportation Institute, Battelle Memorial Institute, Transanalytics, and the University of Michigan Transportation Research Institute. Future IDIQ contracts may include different research organizations. This approach ensures that the most technically qualified, cost-effective entity wins the contract.
To help maximize Federal R&T funds, FMCSA contributes annually to the National Surface Transportation Safety Center for Excellence (NSTSCE), an organization established by the Federal Public Transportation Act of 2005 to develop and disseminate advanced transportation safety techniques and innovations. This organization is supported financially and guided by a group of seven public and private stakeholders. Each stakeholder contributes $200,000, for a combined pool of $1,400,000 in research funding. FMCSA is a member of the NSTSCE steering committee, which meets biannually to review surface transportation safety research needs. A prioritized list of potential projects and a multi-year strategic plan—which strives to coordinate NSTSCE research activities with those of FMCSA and other Federal research programs—are presented to the steering committee for review and approval. Approved research projects are then developed and conducted by the Virginia Tech Transportation Institute. For more information about NSTSCE, visit: https://www.vtti.vt.edu/national/nstsce/.

**Technology Transfer (T2):**

**Coordination of T2 Activities**

In addition to consulting with the Research Executive Board (a committee of representatives from many FMCSA offices that have research and technology interests) when planning its portfolio of projects (to include T2 activities), the R&T Program also participates in the USDOT Research, Development, and Technology (RDT) Planning Team, which includes representatives from all of the USDOT modes. Beyond this, R&T Program leadership participates in ITS JPO working groups and meetings and conducts joint research projects with other agencies, such as the Federal Highway Administration and the National Highway Traffic Safety Administration. Through the Innovative Technology Deployment (ITD) Program, FMCSA collaborates closely with States on technology deployment activities, data exchange, etc. These activities ensure the cost-effectiveness of FMCSA T2 efforts and eliminate duplicative T2 activity.

**Program-level T2 Activities:**

FMCSA invests in the development, testing, and transfer of innovative technologies through the following programs and activities:

- **R&T Program:** FMCSA’s R&T Program develops the knowledge, practices, and technologies needed to solve problems and answer questions that arise in prioritizing enforcement resources and improving the safety of commercial drivers, vehicles, and carriers. Each year, the R&T Program sponsors and conducts numerous technology-focused projects designed to:
  - Improve the safety and efficiency of CMVs through technological innovation and improvement.
  - Improve technology used by enforcement officers when conducting roadside inspections and compliance reviews.
  - Test, develop, or assist in testing and developing any material, invention, patented article, or process related to the R&T Program.
  - Facilitate training or education of CMV safety personnel.

- **ITD Grant Program:** The ITD Grant Program provides funding for States to deploy, support, and maintain CMV information systems and networks. This program is FMCSA’s key mechanism for transferring proven enforcement technologies into operational systems for the States. Examples of ITD deployment efforts include the implementation of communications and data exchange mechanisms to facilitate exchange of safety and credentials information within and
among States, Federal agencies, and motor carriers, and the targeting of unsafe motor carriers on the highways using license plate and USDOT number reading cameras to identify non-compliant trucks at highway speeds. Each year, through the High Priority (HP) Grant, the ITD Program provides up to $20M in funding for States to deploy, support, and maintain intelligent transportation systems and commercial vehicle information systems and networks.

HP-ITD grant priorities are published annually in the Agency’s notice of funding opportunity (NOFO) for HP-ITD grants. Grant priorities are informed by data-driven Agency priorities and constant monitoring of the ITD Program, which allows FMCSA to see trends and technologies that have a direct impact on the program. In FY 2018, for example, HP-ITD grant priorities included deploying a work-zone and incident electronic notification system, deploying a CMV truck parking notification system, and deploying thermal imaging technology used in detecting inoperable, defective, or deficient brakes, tires, or exhaust systems that may cause unsafe conditions.

The R&T Program provides program management support for the technical aspects of the ITD Grant Program. The ITD Program Manager (PM) within FMCSA’s Technology Division manages projects and provides grant funding to States to improve motor carrier safety and to accelerate the deployment of safety technologies nationally. The ITD PM also manages the day-to-day safety information exchange between States and FMCSA systems, and promotes State adoption of electronic screening and electronic credentialing technologies. Finally, the ITD PM conducts Core compliance reviews of State ITD programs to ensure States are maintaining the core functional requirements of ITD and managing their open ITD grants effectively.

The ITD PM routinely reports to R&T Program leadership on States’ enforcement-related technology transfer activities. This informs other Agency research and technology transfer priorities and activities.

- **USDOT Small Business Innovation Research (SBIR) Program:** This program encourages small businesses to develop high-tech, innovative transportation solutions that could be commercialized, leading to entrepreneurial growth and economic stimulation. FMCSA participates in the SBIR Program and administers its own SBIR projects through the John A. Volpe National Transportation Systems Center (Volpe Center). The project selection process is highly competitive, and once selected, projects progress by merit through a three-phased program. Each phase must be successful in order to progress to the next phase.
  - Phase I: Establish technical merit, feasibility, and commercial potential. Phase I projects are relatively short-term, approximately 6 months.
  - Phase II: Continue the work begun in Phase I according to the defined commercial potential. Phase II projects can last 2 years.
  - Phase III: The goal of Phase III is to move toward or obtain commercialization.

- **Automated CMV Research:** FMCSA conducts research to accelerate the testing and deployment of proven safety technologies (such as automated emergency braking, or AEB systems) and partners with industry associations, original equipment manufacturers, and motor carriers to promote the acceptance and adoption of these technologies. FMCSA also promotes safe pilot testing of ADS-equipped CMVs and truck platoons, to further evaluate the safety of these technologies and support their deployment.

**T2 Stakeholders**
Federal R&T Program staff, partner modes, contracted research and support staff, SBIR awardees, technology vendors, original equipment manufacturers, State partners, motor carriers, and industry associations are involved in FMCSA’s technology transfer (T2) activities. T2 beneficiaries include State and local governments, law enforcement, Federal and State commercial vehicle inspectors, motor carriers, and CMV drivers.

Federal R&T Program staff and contracted research and support staff are involved in the initial development and evaluation of CMV safety technologies. R&T Program staff manage technology development and testing contracts, working closely with technology vendors and contracted researchers. R&T Program staff and contracted support staff also manage the technical aspects of FMCSA's ITD Grant Program (e.g., ensuring States are meeting minimum requirements for Core ITD compliance). SBIR awardees are tasked with proving the technical merit and feasibility of their innovative technologies, further developing the technologies, and ultimately commercializing any final products. Original equipment manufacturers determine the value of installing proven safety technologies in CMVs and make changes as needed to facilitate production. Federal and State partners and motor carriers often participate in testing of innovative technologies ahead of any nationwide T2 activities.

State and local governments, law enforcement, and Federal and State commercial vehicle inspectors benefit from the R&T Program's T2 activities through improved enforcement technologies. For example, through the ITD Grant Program, States obtain grant funding to acquire and install infrared thermal brake detecting cameras (to identify unsafe brakes, tires, and wheels) and license plate and USDOT number reading cameras to identify non-compliant trucks at highway speeds. Our State partners are also using the ITD Grant Program to further refine and deploy safety systems for fleets, including work zone warning systems for CMV drivers. Motor carriers and CMV drivers also benefit from SBIR-produced technologies, such as the Trucking Fatigue Meter, a data analytics technology that uses existing streams of trucking data to evaluate driver fatigue and provide actionable feedback in real-time.

**T2 Audience and Dissemination of Program Results**

The R&T Program largely supports other FMCSA program offices; as such, the target audience is often an internal FMCSA program office (e.g., Enforcement or Policy). Specific to T2 activities, the intended audience is usually States, law enforcement and inspectors, and fleets. For projects where the outcome is a final report, the Agency will publish the final report via the FMCSA Web site and/or the National Transportation Library (NTL). Depending on Agency communications priorities, the report may be released in conjunction with a press release, News Digest item, or social media post. Findings may also be shared in public forums (e.g., CVSA meetings, the TRB Annual Meeting, etc.). For projects where the outcome is a technology intended for motor carrier use (e.g., the Trucking Fatigue Meter), outreach efforts to specific motor carriers will be organized. When the project outcome is an enforcement technology, the R&T Program will communicate the availability of that technology (and available grant funding to implement said technology) via the ITD Grant Program, through the annual ITD Grant Program Notice of Funding Availability. Table 2 shows the methods FMCSA uses to disseminate R&T Program results.

### T2 Performance Measurement

FMCSA’s R&T Program measures the performance of its T2 activities in multiple ways. First, the Agency tracks State deployments of enforcement technologies through its ITD Grant Program annual reports—published and available via the NTL—which describe the various enforcement technologies the States are implementing with ITD Grant Program funds. Next, during the commercialization phase, FMCSA regularly receives deployment metrics from SBIR awardees. For example, FMCSA can report that the sales pipeline for the Trucking Fatigue Meter is growing. Three motor carriers have signed on as subscribing customers; one of those carriers is deploying the system to 2,000 drivers. For AV-related technology transfer activities, FMCSA will seek regular updates from original equipment manufacturers regarding how many newly manufactured CMVs are equipped with automated CMV safety systems (e.g., AEB). Finally, FMCSA conducts research to assess the effectiveness of enforcement technologies, such as weigh station e-clearance/pre-screening systems.

### T2 Funding Allocation and Staff Resources

Funding and staff resources are allocated to T2 activities for the R&T Program. Within the R&T Program there is a dedicated ITD Program Manager who oversees the technical aspects of the ITD Grant Program. The R&T Program also funds an ITD Program and Technical Support contract (interagency agreement) with the Volpe Center. Contracted staff support the ITD Program Manager and related program activities.

The R&T Program allocates funding and staff resources for SBIR projects. A dedicated R&T staff person manages all SBIR program activities and provides guidance to SBIR awardees as each project progresses through its various phases.

Within the R&T Program there are five staff members focusing on AV research activities. These team members manage a variety of AV research contracts and participate in USDOT and FMCSA AV working groups, attend AV-related conferences and events, collaborate with States and other stakeholders, and work to develop and procure new AV-related research projects. In FY 2020, the Agency has allotted a portion of its research budget to support AV-related T2 activities (e.g., continued funding to support accelerated deployment of AEB systems in CMVs).

Finally, FMCSA allocates funds and staff resources for research conducted under the R&T Program’s “Advance Safety through Information-Based Initiatives” strategic objective area, which typically involves technology-focused projects.

### T2 Representation in the USDOT Research Hub, NTL, and TRB Research in Progress Database
The R&T Program’s T2 activities are represented in the USDOT Research Hub and the NTL Digital Library. When applicable, FMCSA adds project summaries for newly awarded research and technology projects to the USDOT Research Hub and the TRB Research in Progress database. These higher-level project summaries link directly to the master project summaries on the FMCSA Web site, which are updated routinely with information on project funding, summary descriptions of research outputs and impacts, and other relevant project information. Additionally, FMCSA publishes all external-facing final reports via the NTL’s Digital Repository and makes those links available on the FMCSA Web site, as appropriate. See Table 2 for NTL download metrics for FY 2017.

Annual Performance Reporting of T2 Activities

Pursuant to 15 U.S.C. 3710(f), FMCSA reports its T2 activities each year in its modal submission for the overall USDOT Technology Transfer Report. The annual USDOT Technology Transfer Report summarizes Department-wide T2 activities for the past fiscal year and includes success stories from each of the modes. The annual report is submitted to the U.S. Department of Commerce, pursuant to 15 U.S.C. 3710(g)(2).

R&T Program Evaluation/Performance Measurement:

Tracking and Evaluating Progress Towards Objectives and Goals

FMCSA’s R&T Program is a support program that focuses on (1) supporting the goals and priorities of the Agency’s other program offices, and (2) directives from other Federal organizations (e.g., Congress, GAO, etc.). The R&T Program has specific annual performance goals, which demonstrate the program’s outputs and impact across multiple research areas in support of FMCSA’s safety mission and the Department’s Strategic Goals of Safety and Innovation. The R&T Program has an established set of annual performance baselines and produces an annual report (internal) detailing yearly accomplishments.

The R&T Program also has detailed processes for tracking the performance of individual research and technology projects. These individual projects have specific goals that support the overall goals of the R&T Program and the Agency in general. R&T Program staff collect performance information for all active research and technology projects. Monthly progress reports are required for all contracts; these reports and other associated project documentation are maintained in an internal R&T Project Management Database. Other information maintained in this database includes project milestones, strategic objective area(s), period of performance dates, project status, etc. The R&T Project Management Database is updated regularly. Portfolio dashboard reports are generated from this database and used at the program management level and higher to guide decisions.

Program Performance Measures

See Table 3 for the measures the R&T Program uses to track program performance.

**Establishing Baselines, Analyzing Trends, and Evaluating Benefits**

The R&T Program establishes performance baselines, both at the program level and at the project level. The R&T Program reports its annual accomplishments in an internal annual report, produced at the end of each calendar year. Performance baselines at the project level vary based on the work being conducted. Project statements of work establish baselines and expectations, and contracted research teams submit monthly reports detailing progress. R&T Program staff continually monitor contracted research projects to ensure baselines are met.

The R&T Program also has several mechanisms in place for analyzing emergent trends and evaluating the benefits created through DOT-sponsored research. First, the R&T Program collaborates closely with other USDOT modes, participating in multiple working groups and coordinating joint research efforts where justified; when developing annual research plans and participating in the USDOT Research, Development, and Technology (RD&T) Planning Council, the R&T Program works to harmonize its efforts with those of other USDOT modes, ensuring cross-modal collaboration and efficient use of Federal resources.

Next, the Agency’s REB review process includes discussion of the justification for each research initiative; if REB members are aware of other research efforts being conducted by other Federal agencies or State or private organizations, the research idea is re-evaluated and/or removed from the budget request. The REB considers the potential benefits and risks of funding proposed research projects and makes recommendations accordingly.

The R&T Program also works closely with the States and external stakeholders (e.g., industry associations and research institutes) to ensure the Agency’s research and technology portfolio addresses current needs in the transportation safety environment. The Agency is a member of the Committee on Truck & Bus Safety (ANB70) of the Transportation Research Board. This committee is made up of many organizations interested in truck and bus safety. As members of this committee,
FMCSA provides briefs on upcoming research and technology projects and plans; similarly, FMCSA learns about emerging research trends and the research efforts of other organizations on the committee. By maintaining regular communication with the States, independent committees, and industry stakeholders, FMCSA stays apprised of non-Agency-funded research efforts, using that knowledge to inform its research plans.

**Application of USDOT Strategic Plan and Program Evaluation Measures to the R&T Program**

While the R&T Program primarily supports the USDOT Strategic Goals of Safety and Innovation, all four Strategic Goals and numerous Strategic/Management Objectives, Strategies, and Performance Goals in the FY 2018-22 USDOT Strategic Plan apply to the R&T Program, as described below:

- **SAFETY: Reduce Transportation-Related Fatalities and Serious Injuries Across the Transportation System.** In support of the USDOT Strategic Goal of Safety, the Strategic Objective of Systemic Safety Approach, and the associated Performance Goal to Reduce Surface Transportation-Related Fatalities, the R&T Program strives to reduce the number and severity of CMV crashes and enhance the efficiency of CMV operation by providing data, producing statistics, and conducting systematic studies directed toward fuller scientific discovery, knowledge, or understanding. Research conducted by FMCSA contributes to the development of safety technologies (for use by enforcement and commercial carriers) and recommended best practices to improve driver performance and the safe operation of CMVs, thus contributing to a reduction in crashes.

  The Agency measures the safety benefits (i.e., lives saved and crashes and injuries prevented) of its enforcement programs annually, using the Carrier Intervention Effectiveness Model (CIEM) and the Roadside Inspection Effectiveness Model (RIEM). The Agency publishes findings annually. All published RIEM and CIEM reports are available in the National Transportation Library, at [https://rosap.ntl.bts.gov](https://rosap.ntl.bts.gov). FMCSA measures and reports on technology transfer efforts annually in the Agency’s modal submission to the overall USDOT Technology Transfer Report. Published USDOT Technology Transfer Reports for the last eight fiscal years (FY 2010 through FY 2017) are available here: [www.transportation.gov/research-and-technology/dot-tech-transfer-annual-reports](http://www.transportation.gov/research-and-technology/dot-tech-transfer-annual-reports).

- **INNOVATION: Lead in the Development and Deployment of Innovative Practices and Technologies that Improve the Safety and Performance of the Nation’s Transportation System.** FMCSA’s R&T Program supports the USDOT Strategic Goal of Innovation, the Strategic Objectives of Development of Innovation and Deployment of Innovation, and the associated Performance Goals to Increase Dissemination of DOT-funded Research Reports, Increase Production of Tangible DOT-funded Research Outputs, and Increase DOT Technology Transfer Activity. The R&T Program identifies, develops, tests, and deploys innovative roadside and onboard technology solutions and practices, including platooning and automated CMV technologies. FMCSA’s R&T Program works with other FMCSA program offices, the Department, other USDOT modes, and industry stakeholders to safely accelerate the development, testing, and deployment of truck platoons and ADS-equipped CMVs. Ongoing and planned program activities include safety evaluations of truck platoons and ADS-equipped CMVs; establishment of baseline safety measures for automated CMV and

---

3 See Innovation, Strategic Objective 1: Development of Innovation and Strategic Objective 2: Deployment of Innovation, in the FY 2018-22 USDOT Strategic Plan, pp. 29-35

---
truck platoon operations; development, execution, and oversight of pilot programs; technology demonstrations; development of cybersecurity best practices for users of aftermarket electronic systems and original equipment manufacturers; development of inspection tools and criteria for automated CMVs and platoons; and other research to support AV-related regulatory reform.

- **ACCOUNTABILITY: Serve the Nation with Reduced Regulatory Burden and Greater Efficiency, Effectiveness, and Accountability.** While FMCSA’s research and technology projects are primarily focused on the USDOT Strategic Goals of Safety and Innovation, some of them also support the USDOT Strategic Goal of Accountability and the following associated Management Objectives:

  (1) The Management Objective of *Regulatory Reform*, and the related Performance Goal to *Control Regulatory Burden by Complying with Executive Orders to Reduce Number and Economic Impact of Regulations*. The R&T Program supports this Objective and Performance Goal by conducting research to help ensure that rulemaking modifications will not result in negative safety consequences. For example, the R&T Program conducts research to determine whether it is safe for certain CMVs to proceed through railroad grade crossings without stopping or slowing. The current regulation—49 CFR 392.10—requires certain CMVs to stop at all railroad grade crossings, with limited exceptions. Representatives from several industry associations have inquired about the feasibility of amending the regulation to allow certain CMVs to proceed without stopping at railroad grade crossings, especially at crossings that are well-marked and controlled, and on high-speed divided highways. If supported by research findings, the Agency may amend this regulation, thus reducing burden on the industry.

  (2) The Management Objective of *Mission Efficiency and Support*, and the related Small Business Strategy (to promote small business development opportunities). The R&T Program supports this Objective and Strategy by participating in the USDOT SBIR Program. FMCSA invests in SBIR projects focused on the development and commercialization of innovative CMV safety technologies. The R&T Program administers its SBIR projects through the Volpe Center. Both the Volpe Center and assigned FMCSA project managers monitor SBIR projects, to ensure they are meeting performance goals. SBIR projects that reach the commercialization phase are reported in FMCSA’s annual submission to the USDOT Technology Transfer Report. To learn more about FMCSA’s SBIR Program activities, visit: [https://www.fmcsa.dot.gov/research-and-analysis/research/fmcsa%E2%80%99s-small-business-innovation-research-sbir-program](https://www.fmcsa.dot.gov/research-and-analysis/research/fmcsa%E2%80%99s-small-business-innovation-research-sbir-program).

- **INFRASTRUCTURE: Invest in Infrastructure to Ensure Safety, Mobility and Accessibility and to Stimulate Economic Growth, Productivity and Competitiveness for American Workers and Businesses.** FMCSA’s R&T Program indirectly supports the USDOT Strategic Goal of *Infrastructure*, the Strategic Objective of *Life Cycle and Preventative Maintenance*, and the associated Performance Goal to *Improve Conditions of America’s *

---

4 See Accountability, Management Objective 1: Regulatory Reform, in the FY 2018-22 USDOT Strategic Plan, pp. 36-37.
5 See the “Small Business” strategy, under Accountability, Management Objective 2, on pages 8 and 40 of the FY 2018-22 USDOT Strategic Plan.
Transportation-Related Infrastructure\(^6\) by providing technical support to States that are using ITD Grant funds to enhance their enforcement infrastructure (e.g., by implementing virtual weigh stations). States install and maintain weigh stations to enforce truck weight regulations. By implementing virtual weigh stations, States can expand the scope of their truck size and weight enforcement programs, deploying enforcement assets to previously unmonitored areas.\(^7\)

FMCSA reports annually on ITD funding and program activities. ITD annual reports provide detailed information on grant recipients and the projects funded by those grants. ITD program management monitors State ITD activities and conducts conformance tests and certification activities to ensure compliance with program requirements. FMCSA also measures the effectiveness of certain ITD program components—such as e-screening—to ensure program investments are resulting in safety benefits. Learn more about the ITD program at [https://www.fmcsa.dot.gov/information-systems/itd/innovative-technology-deployment-itd](https://www.fmcsa.dot.gov/information-systems/itd/innovative-technology-deployment-itd). Read about FMCSA’s evaluation of e-screening effectiveness here: [https://www.fmcsa.dot.gov/research-and-analysis/technology/effectiveness-weigh-station-pre-clearance-e-screening-systems](https://www.fmcsa.dot.gov/research-and-analysis/technology/effectiveness-weigh-station-pre-clearance-e-screening-systems).

In addition to the USDOT Strategic/Management Objectives, Strategies, and Performance Goals outlined above, the performance measures established in the 2018 R&T Program Evaluation (OST CFO initiative) apply to this program. The measures and associated calculation methodologies are described in detail in Table 3.

**Performance Trend Data**

Trend information for select R&T Program performance measures are included in Table 4. Refer to Table 3 for more information on the R&T Program performance measures.

Performance Against Metrics

The R&T Program is meeting or exceeding its annual targets, sufficiently responding to Agency priorities, Departmental research and budget requirements, Congressional mandates, Office of Inspector General and GAO directives, etc. The R&T Program conducts a significant amount of safety research with limited resources. Research findings and technology outputs support the efforts of other program offices and benefit the States, the motor carrier industry, and the motoring public in general, through increased roadway safety.

Does your program encounter challenges in accessing data for evaluations (case studies)?

No. The Agency maintains a research and technology project database, which houses data for all funded and in-house R&T projects. Additional data is available from research contractors and partners upon request. These data can be used for evaluations (case studies) as needed.
Chapter 2 – High Priority Project Descriptions

High-Priority Projects Planned for FY20

1. **Crash Causation/Factors Study:**
   It has been nearly 15 years since FMCSA and NHTSA completed the original Large Truck Trash Causation Study. There is a need for more current data to support analysis and understanding of the factors that contribute to truck crashes, and subsequently to identify strategies for reducing crashes. This project aligns with the USDOT Strategic Goal of Safety. Planned funding for FY20 is $2.5M to initiate the project; overall funding is to be determined.

2. **Automated CMV Inspection Demonstrations and Evaluations:**
   FMCSA is currently working with a Commercial Vehicle Safety Alliance (CVSA) Task Force to explore and identify processes, communication methods, and inspection technologies to facilitate electronic safety inspections of ADS-equipped CMV operations on the roadway, at borders, and in other enforcement settings. This new effort will demonstrate, test, and evaluate the processes, methods, and technologies recommended by the CVSA Task Force. This project aligns with the USDOT Strategic Goal of Innovation. Planned funding for FY20 (and overall) is $675,000.

3. **Safety Performance of ADS-equipped CMVs with Electronically Controlled Braking Systems (ECBS):**
   ECBS provide electronic activation of all braking system components. These systems rely on the use of electronically-controlled communications systems already existing within single-unit trucks and between the towing vehicle and trailer. ECBS enhances braking precision, whereas conventional braking shortens braking distance. Furthermore, brake-by-wire systems offer potential safety benefits due to their advanced integration with antilock braking systems, electronic stability control systems, and similar electronically-controlled technologies. Finally, ECBS manufacturers cite significant cost savings associated with implementation of brake-by-wire systems, due to optimized wheel brake lining wear and other maintenance-related benefits. NHTSA has already done some feasibility testing on such systems. The next step is to conduct safety performance tests. Together with NHTSA, FMCSA proposes to evaluate the safety performance of ADS-equipped CMVs with ECBS. Findings may inform updates in NHTSA’s Federal Motor Vehicle Safety Standards. This project aligns with the USDOT Strategic Goal of Innovation. Planned combined FMCSA/NHTSA funding for FY20 (and overall) is $750,000.
High-Priority Projects Completed in FY 2018:

1. Safety Study Regarding Double-Decker Motorcoaches with Rear Luggage Compartment (Fixing America’s Surface Transportation Act, 2015 [FAST Act], Section 5510)

   **Background and Objective:**
   Section 5510 of the FAST Act (Public Law 114-94) mandated the Secretary of Transportation to perform this study. The objective was to perform a safety study of the impacts of a rear luggage compartment attached to a double-decker motorcoach on vehicle operations, fire suppression, tire loads, and roadway pavement.

   **Activities:**
   FMCSA conducted a study “regarding the safety operations, fire suppression capability, tire loads, and pavement impacts of operating a double-decker motorcoach equipped with a device designed by the motorcoach manufacturer to attach to the rear of the motorcoach for use in transporting passenger baggage.” In conducting the study, FMCSA consulted with State transportation safety and law enforcement officials.

   **What Was Learned:**
   The rear luggage compartment did not affect safe maneuverability over the range of conditions tested. There is an unquantified concern that the compartment could contain heat in a severe engine compartment fire and lead to breaching the rear window. The tires and rims have adequate capacity for their loads. States must enact limits on tire and axle loads that are consistent with FHWA regulations. The loads under all conditions may exceed some State limits with respect to the FHWA bridge formula.

   **Research Outputs/Outcomes:**

   **Need for Further Research?**
   No; this was a one-time study mandated by Congress.

   **Total Cost:**
   $293,348.00
2. Report on Commercial Driver's License (CDL) Skills Test Delays (FAST Act, Section 5506)

**Background and Goal:**
Pursuant to Section 5506 of the FAST Act, FMCSA developed a report that:
- Describes, for each State, the status of skills testing for applicants for a CDL, including:
  - The average wait time from the date an applicant requests to take a skills test to the date the applicant has the opportunity to complete such test.
  - The average wait time from the date an applicant, upon failure of a skills test, requests a retest to the date the applicant has the opportunity to complete such retest.
  - The actual number of qualified commercial driver's license examiners available to test applicants.
  - The number of testing sites available through the State department of motor vehicles and whether this number has increased or decreased from the previous year.
- Describes specific steps being taken to address lengthy skills testing delays.

**Activities:**
FMCSA surveyed all 50 States and the District of Columbia to understand what their CDL skills test practices were, and to assess wait times and other testing-related questions, as described above. The Agency published the final report in September of 2018.

**What Was Learned:**
While Third-party testing locations trend towards having shorter wait times than State locations, the majority of both State and Third-party testing locations had net wait times under 7 days. From this perspective, States choosing not to use third-party resources did not seem to be significantly adversely impacted.

**Research Outputs/Outcomes:**

**Need for Further Research?**
Not at this time.

**Total Cost:**
$0 (this work was conducted in house)

Research and Technology
Funding Request ($9,073,000)

Program Description/Activities/Objectives:

FMCSA's R&T Program provides scientific safety research on driver behavior, carrier operations, and technology applications. Research includes in-house, contract, congressionally-mandated, and joint-funded studies with other DOT elements, the private sector, and academia.

The R&T Program aims to reduce the number and severity of CMV crashes and enhance the efficiency of CMV operations by: (1) providing data, producing statistics, and conducting systematic studies directed toward fuller scientific discovery, knowledge, or understanding, and (2) identifying, testing, and supporting technology transfer activities and deployment of CMV safety technologies (including automated and connected CMV technologies). Through its activities, FMCSA's R&T Program contributes to the development of expertise, ideas, and tools to advance the state-of-the-art in CMV safety on the Nation's highways and the development and evaluation of future Agency policies, programs, and methodologies.

These contributions have proven critical in identifying Agency enforcement priorities and facilitating technology transfer to the marketplace. Program activities range from demonstrating the efficacy of truck drivers getting proper training and rest to developing best practices for truck platoon and automated CMV deployments. These research efforts provide the underpinnings for empirically answering research questions related to the Departmental goals of Safety and Innovation.

Statutory Requirements:

FMCSA's R&T Program is statutorily mandated.\(^8\) The purpose of the R&T Program is stated in 49 U.S.C. 31108, which establishes a motor carrier and motorcoach research and technology program and delineates the program requirements. Under 49 U.S.C. 31108, paragraph (a)(3)(C), FMCSA may fund research, technology, and development projects that improve the safety and efficiency of CMV operations through technological innovation and improvement.

FMCSA's R&T Program meets the requirements outlined in 49 U.S.C. 31108 by conducting targeted research to improve motor carrier, commercial driver, and CMV safety; improving technology used by enforcement officers when conducting inspections; facilitating transfer of safety technologies to the States through the ITD Grant Program and other avenues; and addressing hazardous materials safety considerations.

Work conducted by FMCSA’s R&T Program primarily aligns with the USDOT Strategic Goals of Safety and Innovation.\(^9\) Research and technology projects primarily address the RD&T Critical

---

\(^9\) FMCSA’s R&T Program supports the USDOT Strategic Goals of Accountability and Infrastructure in some instances. See pages 15 and 26-27 of this research plan for specific examples.
Transportation Topic of *Promoting Safety*. Some of FMCSA’s research and technology projects overlap with the Critical Transportation Topic of *Improving Mobility* (e.g., working to develop interstate best practices for automated CMV deployments, to enable free-flowing commerce across State lines).

**How the Program Supports USDOT Strategic Goals**

FMCSA’s primary mission is to reduce crashes, injuries, and fatalities involving large trucks and buses. Consistent with the USDOT Strategic Goal of *Safety*, described in the USDOT Strategic Plan for FY 2018-22, FMCSA’s R&T Program:

- Conducts research to improve transportation safety specific to the CMV industry.
- Seeks to work effectively with State, local, and private partners to advance its safety mission.
- Addresses commercial driver behaviors to reduce safety risks.
- Consistently strives to improve safety data analysis to guide decisions.

In support of the USDOT Strategic Goals of *Innovation* and *Accountability*, the R&T Program invests in Small Business Innovation Research (SBIR) projects focused on the development and commercialization of innovative CMV safety technologies.\(^\text{10}\) In support of *Safety* and *Accountability*, FMCSA’s R&T Program conducts research to support regulatory reform and relief for motor carriers.\(^\text{11}\) For example, the R&T Program is currently sponsoring the Military Under-21 CMV Driver Pilot Program\(^\text{12}\) to evaluate regulatory alternatives for CMV drivers and motor carriers. The R&T Program is also re-examining the Agency’s vision standard for CMV drivers and evaluating the efficacy of the vision waiver program.\(^\text{13}\) Findings from these projects could identify economic efficiencies in industry operations.

Separately, the R&T Program supports and manages the technical aspects of the Agency’s ITD Grant Program. The ITD Program supports the USDOT Strategic Goals of *Safety* and *Innovation* (and *Infrastructure*, indirectly) by focusing safety enforcement on high-risk operators; integrating systems to improve the accuracy, integrity, and verifiability of credentials; enabling online application and issuance of credentials; and improving State safety inspection efficiency through electronic screening of commercial vehicles traveling at highway speeds past roadside weigh stations. Electronic screening enables inspectors to identify non-compliant carriers—including unpermitted oversize/overweight carriers, which have an impact on the Nation’s infrastructure.

---

\(^{10}\) See the “Small Business” strategy (i.e., “Promote small business development opportunities”) under Accountability, Management Objective 2, on pages 8 and 40 of the FY 2018-22 USDOT Strategic Plan.

\(^{11}\) See the “Regulation” strategy (i.e., “Reduce regulations and control regulatory costs”) under Accountability, Management Objective 1, on pages 8 and 37 of the FY 2018-22 USDOT Strategic Plan.

Autonomous Vehicles

Specific to automated vehicles (AV) and in support of the USDOT Strategic Goals of Safety and Innovation, FMCSA conducts research to ensure the safe operation of automated CMVs on the Nation’s highways; provides voluntary guidance to States and industry AV implementers; researches automated CMV driver factors and vehicle safety components; develops cybersecurity guidance for automated CMVs; establishes data elements and data sharing guidance to support AV testing; and works closely with State and industry stakeholders to fully vet and safely deploy automated CMVs and truck platoons. These activities are conducted under the authority of 49 U.S.C. 31108, through FMCSA’s R&T Program.

Impact on Rural Communities

FMCSA’s R&T Program does impact rural communities. Rural roadways have a high volume of large truck crashes and fatalities. In 2017, 57 percent of fatal crashes involving large trucks were in rural areas.\(^{14}\) FMCSA’s research and technology activities aim to improve CMV transportation safety in all locations, including rural communities. Some examples of FMCSA research efforts that impact rural communities include:

- **Nurse tank research**: FMCSA has conducted several phases of research on pressurized nurse tanks, the containers used to transport anhydrous ammonia to agricultural fields for injection in the soil as fertilizer. Nurse tank failures can be catastrophic, causing fatalities and extensive property damage. FMCSA has discovered that certain manufacturing processes can reduce the safety of these nurse tanks.
- **Automated CMV research**: FMCSA’s automated CMV research activities support the eventual deployment of automated CMVs in rural areas (e.g., Nevada and the Interstate 10 corridor from California to Florida), where the environment is conducive to automated transport.

USDOT Research Priorities:

Every USDOT mode is required to address how its research program(s) will address the following issues, where applicable. FMCSA’s plan for treating relevant issues is summarized below.

- **Economic impact of regulatory reform (critical priority)**: In FY 2020, FMCSA will begin analyzing collected data for the Military Under-21 CMV Driver Pilot Program. Findings from this research effort could identify economic efficiencies for the CMV industry.
- **Economic impact of permitting reform (critical priority)**: The R&T Program will continue to support FMCSA’s ITD Grant Program, which (among other things) provides funding for States to improve their oversize/overweight permitting programs.
- **Performance-based regulations and safety**: In FY 2020, the R&T Program will stand by to support any ongoing or planned FMCSA rulemaking efforts.
- **Potential impact of asset recycling**: While FMCSA will not be conducting research in this area, the Agency is committed to recycling existing Government assets. For example, in FY 2018, FMCSA acquired three Class 8 tractors previously used by NHTSA in the Connected Vehicle Safety Pilot. FMCSA will use these three tractors over the next few years as test vehicles in a series of automated CMV-related evaluations at the Aberdeen Test Center.

---

\(^{14}\) FMCSA, Large Truck and Bus Crash Facts 2016.
• **Potential impact of value capture:** FMCSA’s R&T Program will not be addressing the subject of value capture in FY 2020, as it is outside the scope of the Agency’s safety mission.

• **Improving the mobility of freight:** FMCSA’s research to support the safe deployment of automated CMV-related operations also supports improved mobility of freight. Further, the ITD Grant Program supports improved freight mobility.

• **Feasibility of micro-transit:** FMCSA’s R&T Program will not be addressing the feasibility of micro-transit in FY 2020, as it is outside the scope of the Agency’s mission; however, the Agency will provide input to other modes researching this area, as requested.

• **Improving mobility for underserved communities:** FMCSA’s R&T Program will not be addressing this issue in FY 2020, as it is outside the scope of FMCSA’s mission; however, the Agency will continue to support the safe operation of large trucks and buses nationwide, to include those operating in underserved communities.

• **Cybersecurity:** In FY 2020, FMCSA’s R&T Program is planning to conduct cybersecurity evaluations using its three test tractors operating (sometimes autonomously) and interacting with other vehicles and infrastructure in the test environment. This exploration into the state of CMV cybersecurity will include a risk analysis customized to the test vehicles and environment following an approach defined by National Institute Standards (NIST) 800 series. The evaluation methodology includes steps to: define the operating environment, develop test plans, analyze vulnerabilities, test intrusion detection and prevention systems, and lastly, develop mitigation strategies and retest. Additional research will involve an analysis of J1939 CAN bus traffic to quantify the type, frequency and sensitivity of signal traffic.

**Research Collaboration Partners:**

FMCSA reviews and adjusts its research and technology portfolio each fiscal year to ensure it is addressing relevant, priority issues in support of its safety mission. Issues are identified by the Department and Agency priorities; recommendations from the National Transportation Safety Board (NTSB), the Government Accountability Office (GAO), and other external organizations, such as the National Academy of Sciences (NAS); and Congressional statute. To date, the program’s contributions have proven critical in supporting Agency safety rulemakings, identifying enforcement priorities, and facilitating technology transfer to the marketplace.

The R&T Program works with other program offices and external stakeholders to identify research, data analysis, and technology application needs. FMCSA’s Research Executive Board (REB), comprised of representatives from FMCSA offices with research and technology interests, periodically reviews proposed research and technology projects. The REB is responsible for evaluating, prioritizing, and approving submitted research and technology proposals, ensuring they align with FMCSA and Departmental priorities and are consistent with budget objectives. During formal REB meetings, program offices have the opportunity to present fact-based and data-driven suggestions for future research projects and to comment on past research efforts during these meetings. All feedback is recorded in meeting minutes and reviewed/processed by R&T Program management, and descriptive REB planning books with planned project descriptions are maintained and referred to throughout the research planning and execution process. This continuous review cycle allows the program to adjust its approach to better meet internal stakeholder needs.

For external stakeholders, the R&T Program conducts satisfaction surveys (e.g., for the annual Analysis, Research, and Technology Forum at the Transportation Research Board [TRB] Annual Meeting) and hosts roundtable discussions, public listening sessions, etc., to gain insights from
stakeholders and make program adjustments as needed. All comments and survey responses are recorded and later reviewed by R&T Program Management, who adjust the program approach as appropriate to better meet external customers’ needs.

Finally, the R&T Program maintains a register of research recommendations received from other independent organizations and internal task force committees. This register summarizes each recommendation received and Agency responses to these recommendations, including planned/ongoing research projects or other activities related to a particular recommendation.

**Internal Partners**

FMCSA’s R&T Program coordinates motor carrier research, data analysis, and technology programs with other Departmental offices, Federal agencies, academia and governmental entities; public and private transportation research organizations; and private industry, as appropriate.

Internally, the Agency works closely with numerous modes to align research and development goals. Table 5 summarizes FMCSA’s internal collaboration partners and anticipated collaboration benefits.

**Table 5. Internal DOT Collaboration Partners and Anticipated Benefits.**

<table>

</tr>
</tbody>
</table>

**External Partners**

FMCSA works closely with a select number of external research-based organizations, such as NAS, the Committee on National Statistics (CNSTAT), the National Institute for Occupational Safety and Health (NIOSH), the National Institutes of Health, and the Centers for Disease Control and Prevention. FMCSA partners with these organizations to:

- Conduct expert panel reviews of existing agency programs/research.
- Implement large-scale longitudinal studies on driver health and wellness.
- Develop educational outreach programs aimed at improving driver health and safety.
- Improve agency research methodologies and statistical approaches.
The Agency has a longstanding partnership with TRB and participates in the TRB Annual Meeting, provides research support/guidance via standing committees and task forces, and attends committee-sponsored conferences and workshops.

Specific to AV research, FMCSA is partnering with the U.S. Army and the Department of Energy (and FHWA, internally) to conduct AV-related research on test tracks and dedicated research corridors. The R&T Program is working to establish a partnership with industry trucking associations to accelerate the adoption of automatic emergency braking (AEB) systems in CMVs. Further, FMCSA is working closely with individual States, gathering information on State-specific AV research activities and identifying opportunities for collaboration.

By conducting joint research projects with other modes, FMCSA is able to streamline research efforts and increase project scope. Research findings from these collaborative efforts benefit multiple modes. Separately, FMCSA often cites research conducted by other modes in support of recommended regulatory changes to reduce burden, justifications for new research, etc. FMCSA will continue to benefit from research conducted by the other USDOT modes. Collaborating with external partners enables FMCSA to update and enhance its research and technology program by implementing recommendations, leveraging complementary research activities, and including stakeholder input in setting strategic research objectives.

**Non-government Partners**

Non-government groups do partner with FMCSA’s R&T Program. For example, the R&T Program frequently partners with CVSA—a nonprofit organization representing State and Provincial truck inspection agencies in the United States, Canada, and Mexico—on CMV inspection and enforcement-related endeavors, conducting workshops, developing training modules for inspectors, and updating inspection standards and procedures. The R&T Program is currently working a CVSA task force to develop new inspection tools and procedures to support automated CMV pilot testing.

The R&T Program has also partnered with many motor carriers while conducting specific research projects or initiatives. Finally, as mentioned above, the R&T Program has a longstanding partnership with TRB, a nonprofit organization that “provides innovative, research-based solutions to improve transportation.” This partnership with TRB enables the R&T Program to identify research gaps and collaborative research opportunities, communicate current and planned research efforts, and offer and obtain guidance from other entities within the transportation industry.
Chapter 4 – FY 2021 Program Descriptions

Research & Technology Program

Program Description/Activities:

FMCSA’s R&T Program provides scientific safety research on driver behavior, carrier operations, and technology applications. These contributions have proven critical in identifying Agency enforcement priorities and facilitating technology transfer to the marketplace. Program activities in FY 2021 will continue to support the development and deployment of enhanced enforcement technologies, using the ITD Grant Program as a vehicle for technology transfer; improved data collection, sharing, and analysis; and the development of countermeasures to reduce crashes involving large trucks and buses.

AV research will remain a priority in FY 2021. The R&T Program will begin evaluating SAE level 4 AV technologies, to identify potential safety risks. Additionally, the R&T Program will support the Agency’s regulatory office in evaluating and managing applications for regulatory relief in the form of waivers, exemptions, or pilots under 49 CFR 381 if AV developers submit requests to test ADS-equipped trucks in ways that require regulatory relief from existing Federal Motor Carrier Safety Regulations.

Finally, the R&T Program will conduct congressionally mandated research, respond to other Federal inquiries, and support identified Departmental and Agency priorities, adjusting its research portfolio and approach as needed.

Program Alignment with Strategic Goals:

<table>
<thead>
<tr>
<th>DOT Strategic Goal</th>
<th>DOT RD&amp;T Critical Transportation Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safety</td>
<td>Promoting Safety</td>
</tr>
<tr>
<td>Innovation</td>
<td>Improving Mobility</td>
</tr>
</tbody>

Work conducted by FMCSA’s R&T Program primarily aligns with the USDOT Strategic Goals of Safety and Innovation, although the Program does support the Strategic Goals of Accountability and Infrastructure in some instances. Research and technology projects primarily address the Critical Transportation Topic of Promoting Safety. Some of FMCSA’s research and technology projects overlap with the Critical Transportation Topic of Improving Mobility.

How the Program Supports USDOT Strategic Goals

FMCSA’s primary mission is to reduce crashes, injuries and fatalities involving large trucks and buses. Consistent with the USDOT Strategic Goal of Safety, as described in the USDOT Strategic Plan for FY 2018-22, FMCSA’s R&T Program conducts research to improve transportation safety specific to the CMV industry; seeks to work effectively with State, local, and private partners to advance its safety mission; addresses commercial driver behaviors to reduce safety risks; and consistently strives to improve safety data analysis to guide decisions. In support of the USDOT Strategic Goals of Innovation and Accountability, the R&T Program invests in SBIR projects focused on the development and commercialization of innovative CMV safety technologies. Also in support of the USDOT Strategic Goal of Accountability, the R&T Program conducts research to support regulatory reform and relief. The R&T Program is currently sponsoring the Military Under-21 CMV Driver Pilot
Program to assess the feasibility and safety equivalence of regulatory alternatives for drivers and carriers.

Separately, the R&T Program supports and manages the technical aspects of the Agency’s ITD Grant Program. The ITD Program supports the USDOT Strategic Goals of Safety, Innovation, and Infrastructure by focusing safety enforcement on high-risk operators; integrating systems to improve the accuracy, integrity, and verifiability of credentials; improving efficiency through electronic screening of commercial vehicles; and enabling online application and issuance of credentials.

**Automated CMV Research**

Specific to automated vehicles, and in support of the USDOT Strategic Goals of Safety and Innovation, FMCSA conducts research to ensure the safe operation of ADS-equipped CMVs on the Nation’s highways; provides voluntary guidance to States and industry automated vehicle implementers; researches automated CMV driver factors and vehicle safety components; develops cybersecurity guidance for automated CMVs; establishes data elements and data sharing guidance to support AV testing; and works closely with State and industry stakeholders to fully vet and safely deploy automated CMVs and truck platoons.

**Problems Addressed by the R&T Program**

CMV crashes can be devastating, resulting in loss of life, permanent injuries, and extreme financial hardship. FMCSA’s R&T Program seeks to reduce the number and severity of CMV crashes and enhance the efficiency of CMV operation. The R&T Program strives to achieve this by: (1) conducting systematic studies directed toward fuller scientific discovery, knowledge, or understanding, and (2) adopting, testing, and deploying innovative driver, carrier, vehicle, and roadside best practices and technologies (including automated and connected CMV technologies). By expanding the knowledge and portfolio of deployable technologies and innovations, the R&T Program will help FMCSA reduce crashes, injuries, and fatalities and will deliver a program that contributes to a safe and secure commercial transportation system.

**Why This Research Is Necessary**

The R&T Program serves as the underpinning for empirically answering research questions in support of the Agency’s safety mission and the overall Departmental goals of Safety and Innovation. Using research to better understand factors associated with crashes, FMCSA can streamline and prioritize its efforts, focusing on vital Federal safety oversight functions.

FMCSA’s R&T Program supports the development of effective CMV crash countermeasures, with an end goal of saving lives and reducing the number of CMV-related crashes that occur on our Nation’s highways. The R&T Program also produces voluntary Web-based training modules and tools for CMV inspectors and motor carriers, supporting industry efforts to implement and maintain safety best practices. Additionally, FMCSA’s AV research is critical to improved CMV safety. ADS-enabled vehicles could have substantial implications for the motoring public, as 94 percent of all auto accidents are estimated to result from human error.\(^{15}\) Personal and commercial vehicles equipped with ADS and/or connected vehicle technologies may reach the market in a few years. It is

---

important to test and evaluate these innovative technologies to ensure their safe deployment on our Nation's roadways.

**Others Researching Large Truck and Bus Safety and Related Issues**

**External:** Some independent research organizations (e.g., the American Transportation Research Institute, or ATRI) and motor carrier industry associations (e.g., ATA) conduct research related to safety in the commercial vehicle industry. ATRI surveys the motor carrier industry frequently to identify trends and areas of concern, safety-related and otherwise. The U.S. Army is conducting research related to truck platoons, and other countries are conducting research on truck platoons and ADS-equipped CMVs. FMCSA is aware of the research conducted by these and other external entities, and the Agency uses the resulting literature to inform research plans. While the research conducted by these entities is valuable, FMCSA cannot rely solely on external research findings to inform its oversight activities. As such, FMCSA tailors its research projects to answer inherently governmental research questions.

**Internal:** FMCSA maintains close awareness of what the other modes are doing relevant to motor carrier safety (e.g., automated vehicle research), and the Agency aligns research efforts where applicable. The FMCSA Research Team maintains close contact with counterparts in other modes to share information and identify collaborative research opportunities. Separately, R&T Program management participates in the USDOT RD&T Planning Council, which provides opportunities to collaborate with other modes in like projects to achieve Department-wide efficiencies.

**Previous Investments and Lessons Learned**

FMCSA’s research, development, and technology efforts are statutorily mandated by 49 U.S.C. 31108, which establishes a Motor Carrier R&T Program. As such, FMCSA has invested in motor carrier research activities since it was established as a separate administration within the U.S. Department of Transportation in 2000. Over this time, FMCSA has learned a great deal about motor carrier, CMV driver, and commercial vehicle safety and contributed to the development of safety-focused policies and enforcement tools, improved industry standards, proven CMV safety technologies, and programs geared to improve driver safety (e.g., the North American Fatigue Management Program and the SmartPark Program). Findings from research conducted by FMCSA’s R&T Program can be found in the National Transportation Library: [https://rosap.ntl.bts.gov/cbrowse?pid=dot%3A1&parentId=dot%3A1](https://rosap.ntl.bts.gov/cbrowse?pid=dot%3A1&parentId=dot%3A1).

**Program Timeline**

The R&T Program produces tangible outcomes throughout each fiscal year. Final reports with findings from research projects are published on a rolling basis. Through the ITD Program, FMCSA provides States with the opportunity to invest in and deploy effective enforcement technologies using ITD grant funds, which are awarded annually. Some research projects may take more than a year to complete; however, at any given time, FMCSA will be close to completing a number of other research projects. This ensures a steady flow of outcomes, which inform future research plans.
